# Weighted Superimposed Codes and Constrained Compressed Sensing

#### Wei Dai (ECE UIUC) Joint work with Olgica Milenkovic (ECE UIUC)

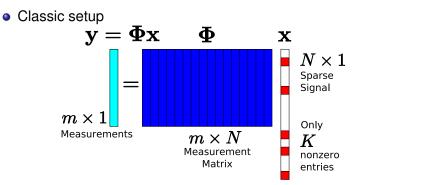

University of Illinois at Urbana-Champaign

#### DIMACS 2009

WSC & Constrained CS

4 **A b b b b b b** 

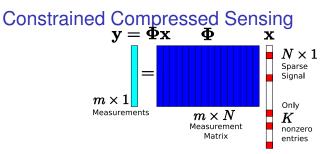

# **Compressed Sensing**

Kashin, 1977; Bresler et al., 1999; Donoho et al., 2004; Candés et al., 2005; · · ·

#### Only one constraint

•  $\mathbf{x} \in \mathbb{R}^N$  is *K*-sparse

- Constraints on x
  - $x_i$ 's are correlated (Dai & Milenkovic; Baraniuk, et al.; · · · ).
  - $x_i$  are bounded integers.
  - May improve performance.
- Constraints on  $\Phi$ 
  - Sparse/structured (Dai & Milenkovic; Indyk, et al.; Do, et al.; Strauss, et al.).
  - $l_p$ -norm + nonnegativity.
  - May introduce performance loss.
- Performance requirement on noise tolerance.

# Application 1: CS DNA Microarrays

DNA Microarray: measures the concentration of certain molecules (such as mRNA) for tens of thousands of genes simultaneously. Major issue: each sequence has a unique identifier  $\Rightarrow$  high cost. CS DNA Microarray (Dai, Sheikh, Milenkovic and Baraniuk; Hassibi)

#### Constraints:

- $\mathbf{x}$  :  $x_i$  =the # of certain molecules.
  - $|x_i| \leq t$ : Bounded integer.
- $\Phi$ :  $\Phi_{i,j}$  =the affinity (the probability) between the probe and target.  $\|\Phi_i\|_{l_1} = 1, \ \Phi_{i,j} \ge 0.$

The same model works for low light imaging, drug screening...

# **Application 2: Multiuser Communications**

A multi-access channel with K users

$$\mathbf{y} = \sum_{i=1}^{K} h_i \sqrt{P_i} \mathbf{t}_i + \mathbf{e}.$$
  
 $\mathbf{t}_i \in \mathcal{C}_i$   
 $\mathcal{C}_i: i^{\text{th}} \text{ user's codebook} \qquad |\mathcal{C}_i| = n_i$ 

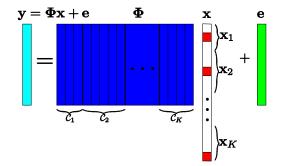

(

# Rate Bounds for WSCs

Definition: Let  $N(m, K, d, t) = \max \{N : \exists C\}.$ The asymptotic code rate is defined as  $R(K, d, t) = \limsup_{m \to \infty} \frac{\log N(m, K, d, t)}{m}.$ 

Theorem:

• For Euclidean norm,  $\frac{\log K}{4K} (1 + o(1)) \leq R(K, d, t) \leq \frac{\log K}{2K} (1 + o_{t,d}(1)).$ • For  $l_1$ -WSC and nonnegative  $l_1$ -WSC  $\frac{\log K}{4K} (1 + o(1)) \leq R(K, d, t) \leq \frac{\log K}{K} (1 + o_{t,d}(1)).$

# Rate Bounds for WSCs

Definition: Let  $N(m, K, d, t) = \max \{N : \exists C\}.$ The asymptotic code rate is defined as  $R(K, d, t) = \limsup_{m \to \infty} \frac{\log N(m, K, d, t)}{m}.$ 

#### Theorem:

• For Euclidean norm,  

$$\frac{\log K}{4K} (1 + o(1)) \leq R (K, d, t) \leq \frac{\log K}{2K} (1 + o_{t,d}(1)).$$
• For  $l_1$ -WSC and nonnegative  $l_1$ -WSC  

$$\frac{\log K}{4K} (1 + o(1)) \leq R (K, d, t) \leq \frac{\log K}{K} (1 + o_{t,d}(1)).$$

< 回 > < 三 > < 三 >

### Interpretation

#### For WSCs,

$$\frac{K \log N}{\log K} \le m \le \frac{4K \log N}{\log K}.$$

The bounds are not independent of d

 $\Rightarrow$  can make the distance arbitrarily close to one.

• For classic CS,

$$m \ge O\left(K \log\left(\frac{N}{K}\right)\right).$$

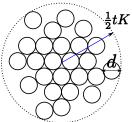

No performance garantee under noise.

# Code Construction and Decoding Algorithms

### • Coding theory:

- Offers myriad of construction techniques.
- ► No efficient decoding methods for WSC codes were known before.

#### • CS:

 Offers decoding algorithmic solutions l<sub>1</sub>-minimization, OMP, SP, CoSaMP ...

### • Combination?

# Decoding

The WESC decoder:  $\hat{x}_i = \text{round} (\mathbf{v}_i^* \mathbf{y}).$ no iteration. OMP: K iterations.

Discrete input  $\Rightarrow$  complexity reduction The WESC decoder: O(mN)OMP: O(KmN)

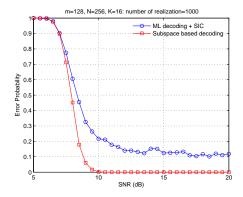

Code Rate for both WESC decoder and OMP:

$$R \le \frac{1}{8K^2t^2} \Rightarrow m = O\left(K^2 \log N\right).$$

Dai and Milenkovic (UIUC)

### Multiuser Interference Cancellation and Decoding

- High mobility  $\Rightarrow$  No channel information at transmitters.
- Coding and decoding motivated by CS.

## Conclusion

WSCs for constrained CS:

- Quantified the code rate
- Noise tolerance
- Efficient decoding

-
